- **FREE SHIPPING**

### TECH TIP

### Digital Picture Sizing - For Web or For Print?

Have you ever put a digital picture on a website only to have it load extremely slow? Have you ever printed a digital picture and have it turn out all "grainy" and "blocky"? Well, these are common problems but there is something you can do. In general, the problem has to do with the resolution of each picture. Resolution is stated in dpi (dots per inch) and determines the quality of the picture. The higher the dpi the better the quality but also the larger the file size becomes. Basic guidelines are as follows: For pictures on the web keep the resolution around 72dpi as a computer screen can only display up to this resolution and it keeps the file size lower for fast loading. For printing, the resolution should be anywhere from 200dpi to 600dpi or higher depending on the picture and the physical size of the print.
